

Application No. 10/661,800
Amendment Dated September 5, 2006
Reply to Final Office Action of June 5, 2006

LISTING OF CLAIMS

1. (Currently amended) An apparatus for use in gripping a cylindrical member, the apparatus comprising:

a jaw body for delivering the gripping apparatus to the cylindrical member;

an insert having teeth for gripping the cylindrical member, wherein said insert is supported by and movable relative to said jaw body;

a cam member having a longitudinal axis, a first camming surface, and a second camming surface;

wherein said cam member is rotatably supported by said jaw body and said cam member is movable relative to said insert; and

wherein said cam member is disposed between said jaw body and said insert, said first camming surface configured to engage said jaw body and said second camming surface engages said insert such that when said insert moves relative to said jaw body and said cam member, said cam member rotates about said longitudinal axis.

2. (Original) The apparatus of claim 1 wherein said cam member is generally cylindrically shaped.

3. (Original) The apparatus of claim 1 wherein:

said cam member has a base portion and a lobe portion, said base portion having a base camming surface and said lobe portion extending from said base portion and having a lobe camming surface; and

said insert has a C-shaped groove for receiving said lobe portion and engaging said lobe camming surface.

4. (Original) The apparatus of claim 3 wherein said base portion has a base width and said lobe portion has a lobe width, wherein said base width is greater than said lobe width.

Application No. 10/661,800
Amendment Dated September 5, 2006
Reply to Final Office Action of June 5, 2006

5. (Original) The apparatus of claim 1 further comprising a plurality of said inserts and a plurality of said cam members such that when a force is applied to said inserts, said inserts move and said cam members rotate substantially simultaneously, thereby intensifying the gripping force exerted on the cylindrical member.

6. (Original) The apparatus of claim 1 wherein said body further comprises a cam face having an insert recess and a cam member recess, wherein said insert is disposed within said insert recess and said cam member is disposed within said cam member recess such that said body and said insert substantially enclose said cam member.

7. (Original) The apparatus of claim 6 wherein said cam member further comprises a body camming surface and an insert camming surface, wherein said body camming surface cammingly engages the surface of said cam member recess and said insert camming surface cammingly engages the surface of said insert recess.

8. (Original) The apparatus of claim 1 wherein said cam member extends substantially the entire length of said body.

9. (Original) The apparatus of claim 1 further comprising a means for supporting said cam member.

10. (Currently amended) The apparatus of claim 9 wherein said supporting means comprises:

~~said body having a top end and a bottom end, wherein said top and bottom ends lie in planes substantially perpendicular to said longitudinal axis of said cam member;~~
a first plate releasably attached to said jaw body~~top end~~; and
a second plate releasably attached to said jaw body~~bottom end~~.

11. (Canceled).

Application No. 10/661,800
Amendment Dated September 5, 2006
Reply to Final Office Action of June 5, 2006

12. (Canceled).

13. (Original) The apparatus of claim 1 further comprising a means for supporting said insert.

14. (Canceled).

15. (Canceled).

16. (Canceled).

17. (Original) The apparatus of claim 3 further comprising a means for supporting said insert.

18. (Canceled).

19. (Previously amended) An apparatus for use in gripping a cylindrical member, the apparatus comprising:

a jaw body having an engaging face and a cam face, said cam face having at least one insert recess, wherein said insert recess further comprises at least one cam recess;

a cam member having a longitudinal axis and extending through said cam recess, said cam member having a first camming surface engaging the surface of said cam recess and a second camming surface opposite said first camming surface;

at least one insert having teeth for gripping the cylindrical member, said insert engaging said second camming surface and partially disposed within said insert recess; and

wherein said cam member is rotatable about said longitudinal axis such that when said insert moves relative to said jaw body, said cam member rotates.

Application No. 10/661,800
Amendment Dated September 5, 2006
Reply to Final Office Action of June 5, 2006

20. (Original) The apparatus of claim 19 wherein:

said cam member has a base portion adjacent said first camming surface and a lobe portion extending from said base portion and adjacent said second camming surface;
and

said insert has a C-shaped groove for receiving said lobe portion and engaging said second camming surface.

21. (Original) The apparatus of claim 20 wherein said base portion has a base width and said lobe portion has a lobe width, wherein said base width is greater than said lobe width.

22. (Canceled).

23. (Canceled).

24. (Canceled).

25. (Canceled).

26. (Original) A jaw assembly for use in gripping a cylindrical member, the jaw assembly comprising:

a tong body;

at least two piston cylinders supported by said tong body such that said piston cylinders are circumferentially spaced about the cylindrical member, each of said piston cylinders having a piston extending through said piston cylinder;

first and second hydraulic fluid conduits supported by said tong body, wherein said first and second conduits are in fluid communication with said piston cylinders;

a jaw body removably attached to each of said piston cylinders;

an insert having teeth for gripping the cylindrical member, wherein said insert is supported by and movable relative to said jaw body;

Application No. 10/661,800
Amendment Dated September 5, 2006
Reply to Final Office Action of June 5, 2006

a cam member having a longitudinal axis, wherein said cam member is rotatably supported by said jaw body; and

wherein said cam member is disposed between said jaw body and said insert and configured to engage said jaw body and said insert such that when said insert moves relative to said jaw body, said cam member rotates about said longitudinal axis.

27. (Original) The apparatus of claim 26 wherein:

said cam member has a base portion for engagement with said jaw body and a lobe portion extending from said base portion for engagement with said insert; and said insert has a C-shaped groove for receiving said lobe portion.

28. (Original) The apparatus of claim 27 wherein said base portion has a base width and said lobe portion has a lobe width, wherein said base width is greater than said lobe width.

29. (Currently amended) A method for gripping a cylindrical member, the method comprising:

delivering a gripping apparatus to the cylindrical member, the gripping apparatus comprising:

a jaw body for delivering the gripping apparatus to the cylindrical member;

an insert having teeth for gripping the cylindrical member, wherein said insert is supported by and movable relative to said jaw body;

a cam member having a longitudinal axis, a first camming surface, and a second camming surface;

wherein said cam member is rotatably supported by said jaw body and said cam member is movable relative to said insert; and

wherein said cam member is disposed between said jaw body and said insert, and said first camming surface configured to engage said jaw body and said second camming surface engages said insert such that when said insert moves

Application No. 10/661,800

relative to said jaw body and said cam member, said cam member rotates about said longitudinal axis;
engaging said insert teeth with the cylindrical member;
imposing a gripping force on the cylindrical member;
rotating said gripping apparatus, thereby moving said insert and rotating said cam member; and
intensifying said gripping force.

30. (Original) The method of claim 29 wherein:

said cam member has a base portion and a lobe portion, said base portion having a base camming surface and said lobe portion extending from said base portion and having a lobe camming surface; and

said insert has a C-shaped groove for receiving said lobe portion and engaging said lobe camming surface.

31. (Original) The method of claim 30 wherein said base portion has a base width and said lobe portion has a lobe width, wherein said base width is greater than said lobe width.

32. (Original) The method of claim 29 further including the step of preventing slippage of the insert teeth relative to the cylindrical member.
